INTRODUCTION

The pattern of healthcare systems has been substantially affected in several ways by the emergence of the new Corona Virus called SARS-Cov-2 or COVID-19 in December 2019, later termed a pandemic in March 2020 by WHO. Considerable change has taken place in the delivery and utilization of health care services due to the risk of Covid-19 transmission. Since the virus spreads mainly through droplets of the mouth or nose during breathing, coughing and sneezing, dental services have been greatly affected. This is mainly due to the proximity of the dental practitioner or student to the patient's mouth. The healthcare system has focused on essential preparation to reduce the transmission of COVID-19. Dental education plays an important role in training and improving the knowledge of healthcare professionals and implementing infection control measures to curb the spread. The educational process has also been adversely affected in many ways. Due to the advancement of this disease, the World Health Organization (WHO) enforced strict regulations impacting routines and day-to-day life, including the closure of educational institutions the world over. Since most educational institutions shut down their campuses during the first and the second waves, there was a transition from physical attendance to virtual learning. In the initial stages of Covid-19, Pakistan and other countries started implementing precautionary measures like social distancing and closure of educational institutions to curb and alleviate the problem. The social distancing concept entails most education providers shifting their teaching online using various learning methods. This was put into effect. Online learning systems are web-based software for distributing, tracking and administering courses online. In Pakistan, video conferencing was made possible using online learning management systems such as Microsoft Teams, Google Meet, Zoom and Moodle. They provided features like whiteboards, chat rooms, quizzes, polls, discussion forums and surveys that facilitated teachers and students to connect online and share course content simultaneously. In dentistry, among the students most affected by the pandemic were those in...
The third and fourth clinical years, as their learning was stunted due to limited resources. One of the subjects taught in the third year of the Bachelor in Dental Surgery program is Oral and Maxillofacial Pathology. Its speciality focuses on the clinical, radiographic and microscopic diagnosis of pathological conditions affecting the oral and maxillofacial regions. Students are uniquely trained to address the diagnosis and treatment of oral diseases, aiding the rapid critical connection between oral and systemic diseases and combining expertise in histopathological diagnosis with clinical diagnosis and treatment outcomes. This links the training of students in basic sciences with application in clinical dentistry. The Oral Pathology department plays a significant role in training them for this unique and diverse field of dentistry. Various advancements have taken place in textbooks, internet research and conferences, but there remains a gap between understanding and interest in the subject among students, partly due to them viewing it as a non-clinical subject and therefore carrying less scope for practice. Like any other department affected by COVID-19, the Oral Pathology department also faced challenges and gained experience transitioning from physical to online education learning systems. Some difficulties met along the way were lack of faculty training in online education learning systems, lapses in internet connection, limited student attendance, gaps in communication, insufficient interaction from students and dubious authenticity of results due to cheating. The present study aims to evaluate and assess the challenges faced by dental students in studying oral pathology online and to take necessary measures to improve the teaching process. It also seeks to bridge the gap between student and teacher to facilitate a conducive learning environment and provide adequate online teaching skills to make students competent graduates, members of the dental fraternity and oral pathologists.

METHODOLOGY

Approval from the ethical review committee was acquired before the commencement of the study (AIDM/ERC/04/2022/03). A descriptive and analytical cross-sectional study was carried out in the department of oral pathology at Altamash Institute of dental medicine, where the prepared questionnaire in the form of closed-ended questions assessing the challenges faced by students during the COVID-19 pandemic was distributed to the students of 3rd and final year of the institute. First, second-year and postgraduate students were excluded from the study. The questionnaire was drafted by consulting similar previously published studies. A total of 105 students formed the study group. All participants were informed about the nature of the study, and informed consent was taken from them. The students were not obligated to fill out the questionnaire. The questionnaire comprised two segments. The first segment comprised demographic details, and the second consisted of questions focusing on understanding oral pathology theory and practice online. Data were analyzed using SPSS version 23. Frequency and percentage were reported for categorical data like gender, year of study, and challenges faced by the students. Challenges faced by the students were compared with gender and year of study using Chi-square/Fisher exact test. A p-value ≤0.05 was considered statistically significant.

RESULTS

After increasing the sample size by 10% for non-responders, 110 participants were approached; 105 participants responded and completed the survey. Of 105 participants, 78% were females, and 22% were males. Most of the students from the final year participated in the survey (84.8%), and 15.2% of the students were from 3rd year.
Table 1: Challenges Faced by the Students during the COVID-19 Pandemic

**DISCUSSION**

The crisis related to the COVID-19 pandemic is ever-growing because it is highly contagious, novel and has psychological effects. Consequently, various countries have taken important steps to control disease transmission. The transmission has impacted the educational process at all levels, including dental education. Dental students face numerous challenges, adversely affecting their education, conduct, teamwork and mental health. Distinct Studies highlight that dental students in a typical setting will face much stress throughout their education, primarily from workload, clinical requirements, assessments and grades. The purpose of our study is to assess the challenges faced by dental students in studying Oral Pathology online. The base of a dental graduate is built upon the knowledge and understanding of pathological diseases at a microscopic level. This makes it imperative that the students develop an interest in the subject. Our study evaluates challenges encountered by the students attending online Oral Pathology lectures and practicals, the outcome of which is then compared with gender and year of study. The female response percentage was higher than the male (figure 1) since more female students are in the institute. Regarding the year of study, fourth-year students responded more than third-year students (figure 2) because the former experienced greater challenges in learning. They were concerned about applying knowledge from previous years about their clinical skills. One of the challenges of online learning is to grasp the student’s attention and hold their interest in understanding the topic. This is less troublesome than the traditional way of teaching. Many teachers believe online education is more time consuming and reduces students' engagement, leading to less favourable academic success than conventional face-to-face instruction. One of the findings of our study regarding student satisfaction with the number of online classes and an in-depth understanding of the topic was that female students were significantly more satisfied than male students (p=0.034). The fourth-year students showed significantly higher satisfaction with the number of online theory and practical classes than third-year students (p=0.045). This, a related survey indicates that many students think that asynchronous video lectures are a good alternative to traditional lectures. Synchronous lectures on, e.g. Zoom are less desirable among the students. That being said, most students felt in-person lectures were more effective than online lectures (p=0.035) and that there should be more interactive sessions with the faculty members. This is consistent with the study that shows more students disagree that distance learning offers similar learning compared to a classroom (Amir et al.2020). As discussed by (Martins et al. 2020), online learning is not the same as transferring the traditional lecture to a web-based platform. A major concern during the pandemic was how well the students would perform in their academic examinations. For Oral Pathology, students generally faced difficulty identifying the clinical and histological pictures in the OSPE exam. The outturn of our study shows that after attending the online Oral Pathology lectures and practicals, the female students faced more difficulty identifying pictures (clinical, histological, and radiographic) than the male students (p=0.013). They also encountered more problems during Oral Pathology OSPE exams (p=0.002). This could be due to an examination of a stress-related factor in females that has an effect on their performance which is compatible with the study that overall performance challenges perceived by females are significantly higher (p < 0.05).
than by males (Hammad et al. 2022). Moreover, Mekhemar et al. show that dental students experienced mild anxiety, stress and depression during the pandemic, and women were significantly more affected than men. In future, the research could focus on designing effective online lectures and improving the quality and dynamic of online content. Future research could also highlight blended learning rather than online or traditional face-to-face learning. The recommendations from students about improving online education should also be incorporated into future research.

LIMITATIONS

Concerning the limitations of our study, our research represents only dental students at one institute in Karachi. Perspectives from other institutes could help establish a clear picture of the stressors of the COVID-19 pandemic, as perceived by dental students regarding oral pathology. Additionally, a limited number of questions were asked to measure the impact of COVID-19 on students, which could also be considered a limitation. Moreover, the questions of this study relied on a self-administration survey; consequently, the interpretations and analyses may have led to a bias compared to face-to-face interviews.

CONCLUSIONS

The present study discovered that the students were well versed on the whole about Oral Pathology. They encountered difficulties during the Covid-19 pandemic, but those can be handled and overcome considerably if proper measures are taken. Along with the students, faculty members also experienced the effects of the pandemic on their performance, output and teamwork. To remedy this, students and faculty should be aware of the changing trends in teaching. These trends should be incorporated routinely to enhance academic performance.
